Project Overview

False Exit is a short first-person horror prototype built around one clear idea: the player is under constant pressure, and even the exit cannot be trusted. The experience is designed around chase tension, deceptive navigation, and environmental hazards, with a second phase that shifts the pressure from speed to careful footing.

Design Goal	Create a readable but stressful level where players learn through quick failure, route recognition, and escalating environmental pressure.
Level Structure	Start chamber -> main hall -> hazard zones -> fake exits -> rejoin path -> final tunnel -> real exit.
What this shows	Spatial readability, player guidance, blockout composition, pacing, atmosphere, and visual landmarking for navigation.

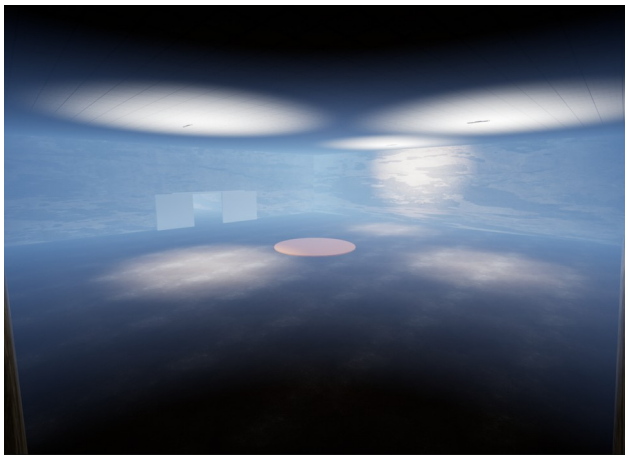
Atmosphere and Readability

The visual language uses cold bloom, fog, broad light pools, and clean silhouettes to keep the space readable while still feeling uncanny and unsafe.

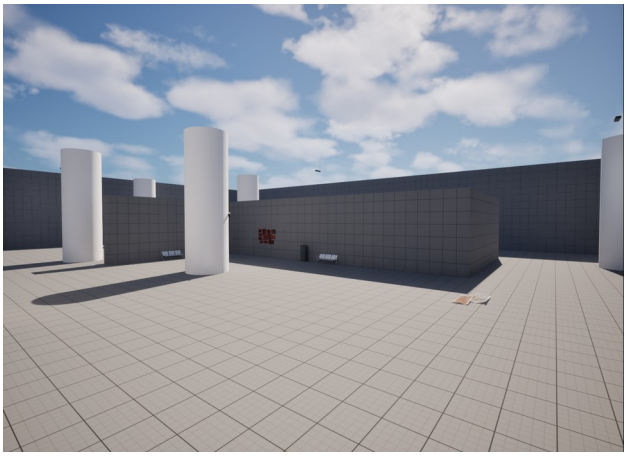


Main hall prototype shot: central landmarking and a soft-lit focal point establish orientation before the player commits to a route.

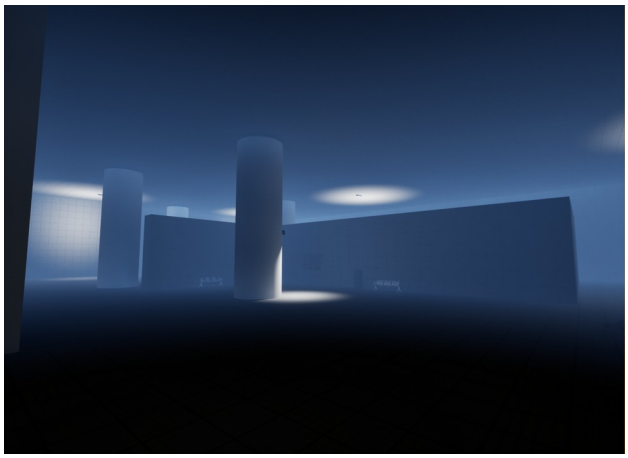
Corridor framing toward a bright double-door exit. The high contrast creates a tempting target while the surrounding darkness preserves tension.

Navigation, Sightlines, and Tension

These blockout shots focus on how columns, half-walls, and open lanes can create hesitation, conceal information, and still preserve enough visual logic for player decision-making.



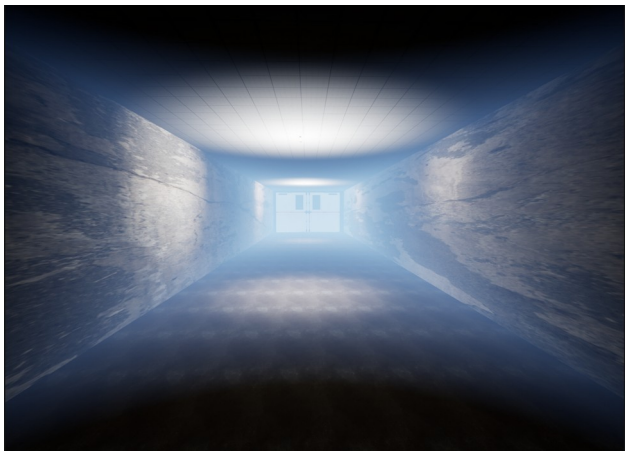
Exterior-scale blockout view of the major partitions and route-defining structures.



Low-angle blockout composition highlighting cover, peripheral clutter, and the oppressive open void above the play space.

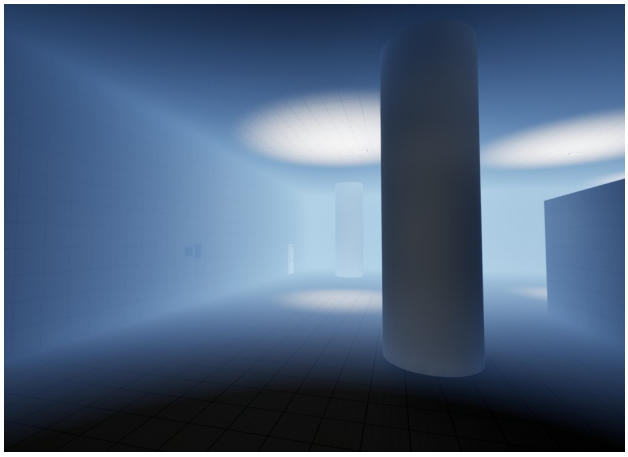
Additional In-Engine Views

Selected captures showing alternate player-facing angles, atmosphere tuning, and how the same layout reads from different traversal points.



Straight corridor run-up to the exit silhouette.

Dense fog treatment with long-range landmark visibility.



Side corridor angle with a large column interrupting sightlines.

What This Prototype Demonstrates

- Blockout-first thinking with an emphasis on clear player pathing and visual landmarking.
- Use of space, lighting, and fog to balance mood with gameplay readability.
- A level design concept built around false information, route recovery, and pressure escalation.
- Portfolio-ready presentation of a compact horror prototype developed in Unreal Engine 5.
